

Drug Metabolism Research Products

The disposition of a drug or xenobiotic (any foreign chemical) within a living organism encompasses all reactions/ physiological mechanisms resulting in Absorption, Distribution, Metabolism and Excretion (ADME) of the molecule. ADME influences the concentration and kinetics of exposure to the tissues and hence determines the effects of a given compound. Biovision has recently launched a new product line dedicated to study various aspects of drug metabolism and excretion. Our assay kits, small molecule chemicals, proteins and antibodies can be used in drug discovery, toxicity studies, drug metabolism and pharmacokinetics, drug-drug interaction studies, inhibitor or ligand screening, Structure activity relation (SAR) experiments and more.

Protein targets in Drug absorption, metabolism and elimination

Influx transporters: OATP, OAT, OCT, NTCP

Efflux transporters: P-Glycoprotein, MRP2, BCRP, MDR2

CYP: Cytochrome P450

UGT: UDP-glucuronosyltransferase
