

# Specialized Pro-Resolving Mediators

Specialized pro-resolving mediators (SPMs) are an important group of signaling molecules derived from arachidonic acid, eicosapentaenoic acid, docosapentaenoic acid, and docosahexaenoic acid that is liberated during the inflammatory process. Studies have shown that resolvins, lipoxins, maresins, and protectins evoke responses that help to resolve an inflammatory episode. Cayman has synthesized an array of these key lipid mediators to aid in a better understanding of this process.
